Being wrong in public is my biggest source of personal growth.

Frontend Software Engineer — Mercado Libre
📅 Sept 2019 - Present

I'm part of Mercado Libre distribution system tech team. The system is a set of dozens of microservices mainly written in Golang. I develop the micro frontends using Javascript, React and Node, but I also develop the backend when necessary. Daily basis responsibilities:

- Understand the logistics strategy and quickly adapt the system so that the operation reaches maximum efficiency in the processing of packages;
- Develop solutions together with the team, as well as review code, document new APIs, write test scenarios and execute them;
- Deploy and release applications with AWS.

Fullstack Software Engineer — GoGood
📅 June 2018 - July 2019

Developed a mobile application that tracks good habits. As the company was a raising startup my team was really lean. I was responsible for:

- UX discovery to discover how to create highly engaged experiences;
- development of the solution, both of the application in React Native, and the backend in Ruby on Rails;
- Releases plan, deploys and publication in the app stores, as well as bug solving and customer success support.

Agile Coach — Knowledge 21
📅 Sept 2017 - Jan 2018

I worked as a digital transformation consultant in some of the biggest industries and banks of Brazil. I delivered assessments on culture, business, processes and technology. I also gave training on agile methodologies and product management.

Quality and process analyst / Agile Coach — Softplan
📅 July 2015 - Sept 2017

I accepted the challenge of guiding process improvement projects, aiming at fulfilling SLA with customers. I was responsible for process quality control for ISO 9001 audit, also training on the processes and tools. Notorious projects:

- we managed to reduce the bureaucracy of the analysis, facilitating communication with the user and the beginning of a culture of user stories;
- The user story acceptance criteria gave rise to a new project to talk about the culture of software quality and automated testing;
- RTC tool configuration.

Other — Softplan
📅 March 2009 - July 2015

Business analyst: Worked with a team responsible for the ERP Financial module. I was responsible for understanding the needs of the construction companies, analyzing the changes, preparing a budget based on cost and scope, providing UML documentation for the team and planning the delivery timing. I was the focal point of the team to serve clients, answer questions and make decisions about prioritization.

Java developer: I developed an ERP for the construction industry, a large monolith written in Java. At this time I was able to learn about automated tests, TDD and how clean code and good design can impact maintenance costs.
